Chartbook: Stocks of Interest

Note \$SUM This has a double bottom in the mid to low 'teens. I has started to rally and could test 22 or so. [Chart](#) 11h

Note \$SUM This is a bad chart although oversold, and could test 15 or so. If it holds there and the weekly stochastic turns up, it is a high risk buy. [Chart](#) 3y

Chartbook: Stocks of Interest

Note \$GNK This has hit the first objective of the base from 7 to 9. Now a hold, but the intermediate chart may have just started to go. New lows would be a concern for investors, but this could test 14 after some consolidation. [Chart](#)

Chartbook: Stocks of Interest

Chartbook: Stocks of Interest

Note \$CBRE Remains strong from 49 days ago and the buy worked nicely. Would remain long but not add. Chart

Note \$CBRE This is an intermediate-term uptrend, with support between 46 and 44. The sstochastics have recycled, so we could buy this name. Chart

Chartbook: Stocks of Interest

Note \$STNE This has rallied enough to turn into a hold as it is overbought. It might test 40 or so. [Chart](#) 11h

Note \$STNE this is fairly new, but has a double bottom and is holding with a wekkly stochastic that is almost oversold. Buy with as 24 or so stop as it is new, but a test of 35 is possible. [Chart](#) 56d

Chartbook: Stocks of Interest

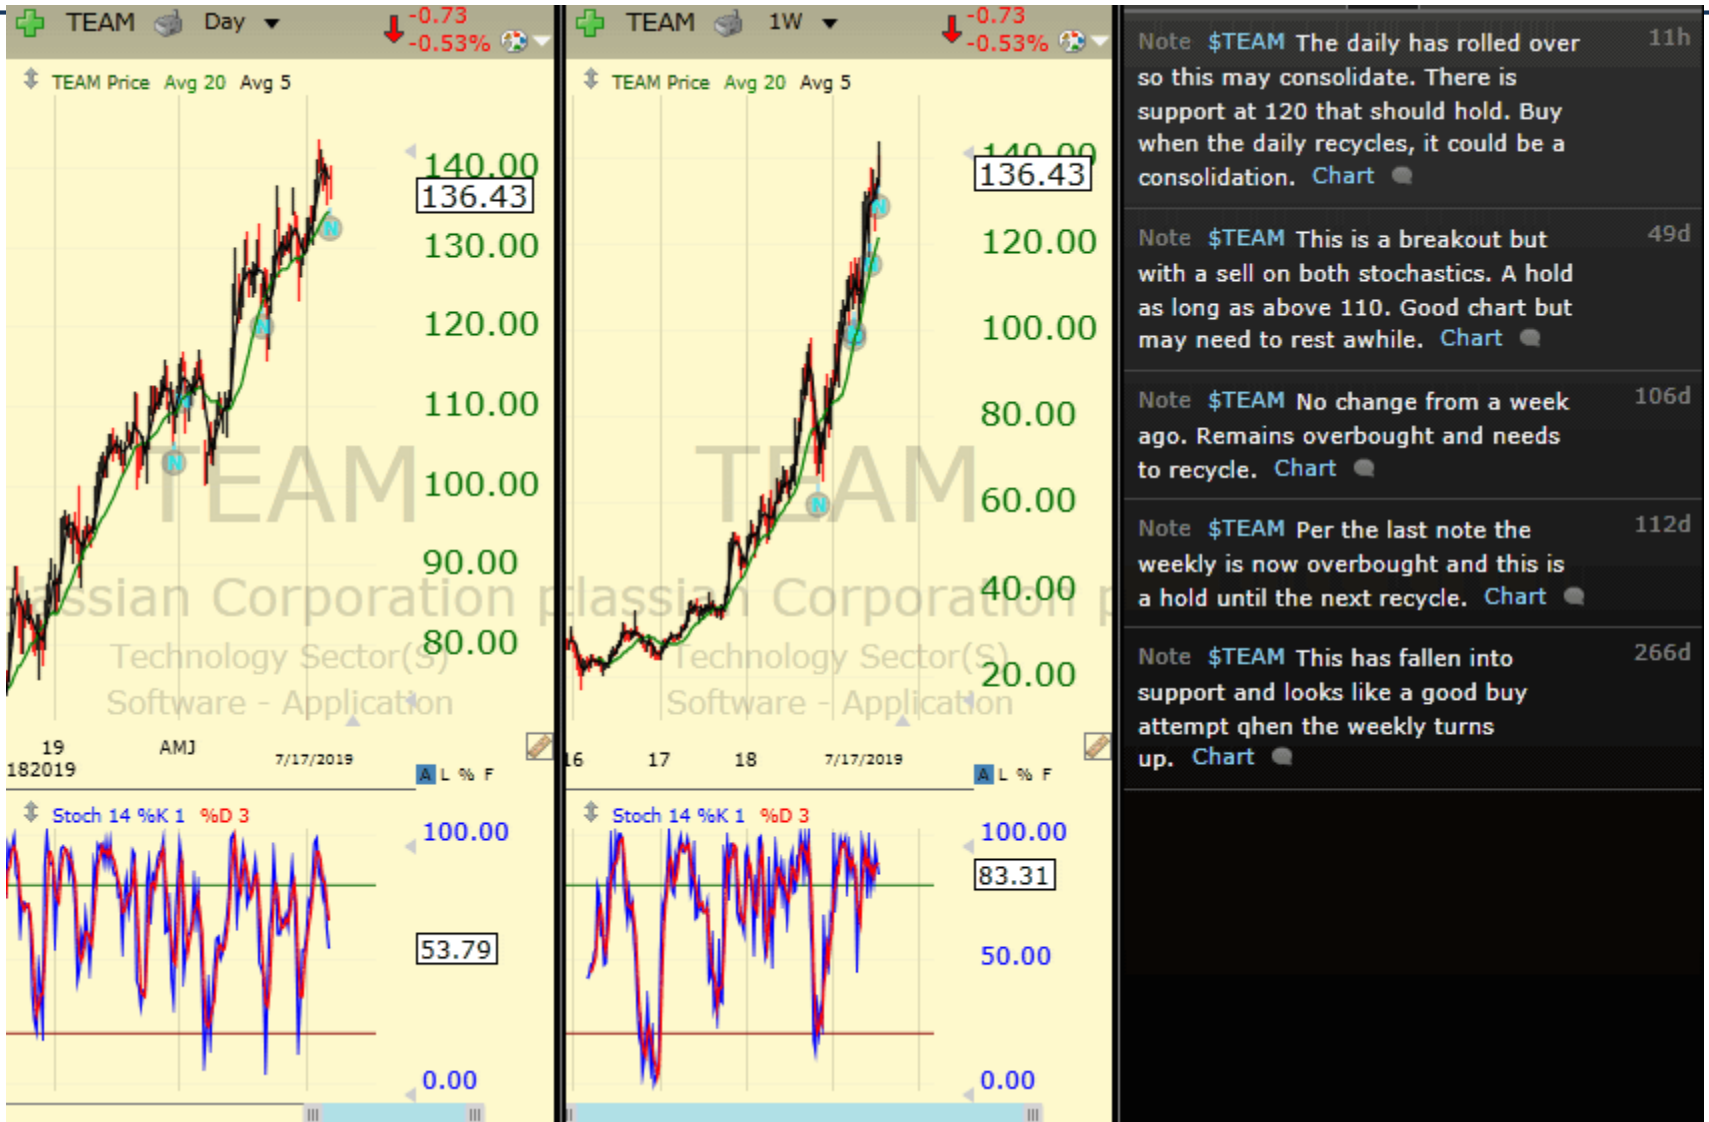

Chartbook: Stocks of Interest

Chartbook: Stocks of Interest

Note \$UPLD This may consolidate or worse, sell off and test 40 or slightly lower. There are weekly stochastic sell signals, and a spikey high in the 55 to 50 area. A hold that could test 40 within the context of this consolidation. Chart

11h

Chartbook: Stocks of Interest

Note \$DWSH Starting to get going. 13h
 OKay to add here with a stop at \$25. Could run to \$28 easily and then \$30. [Chart](#)

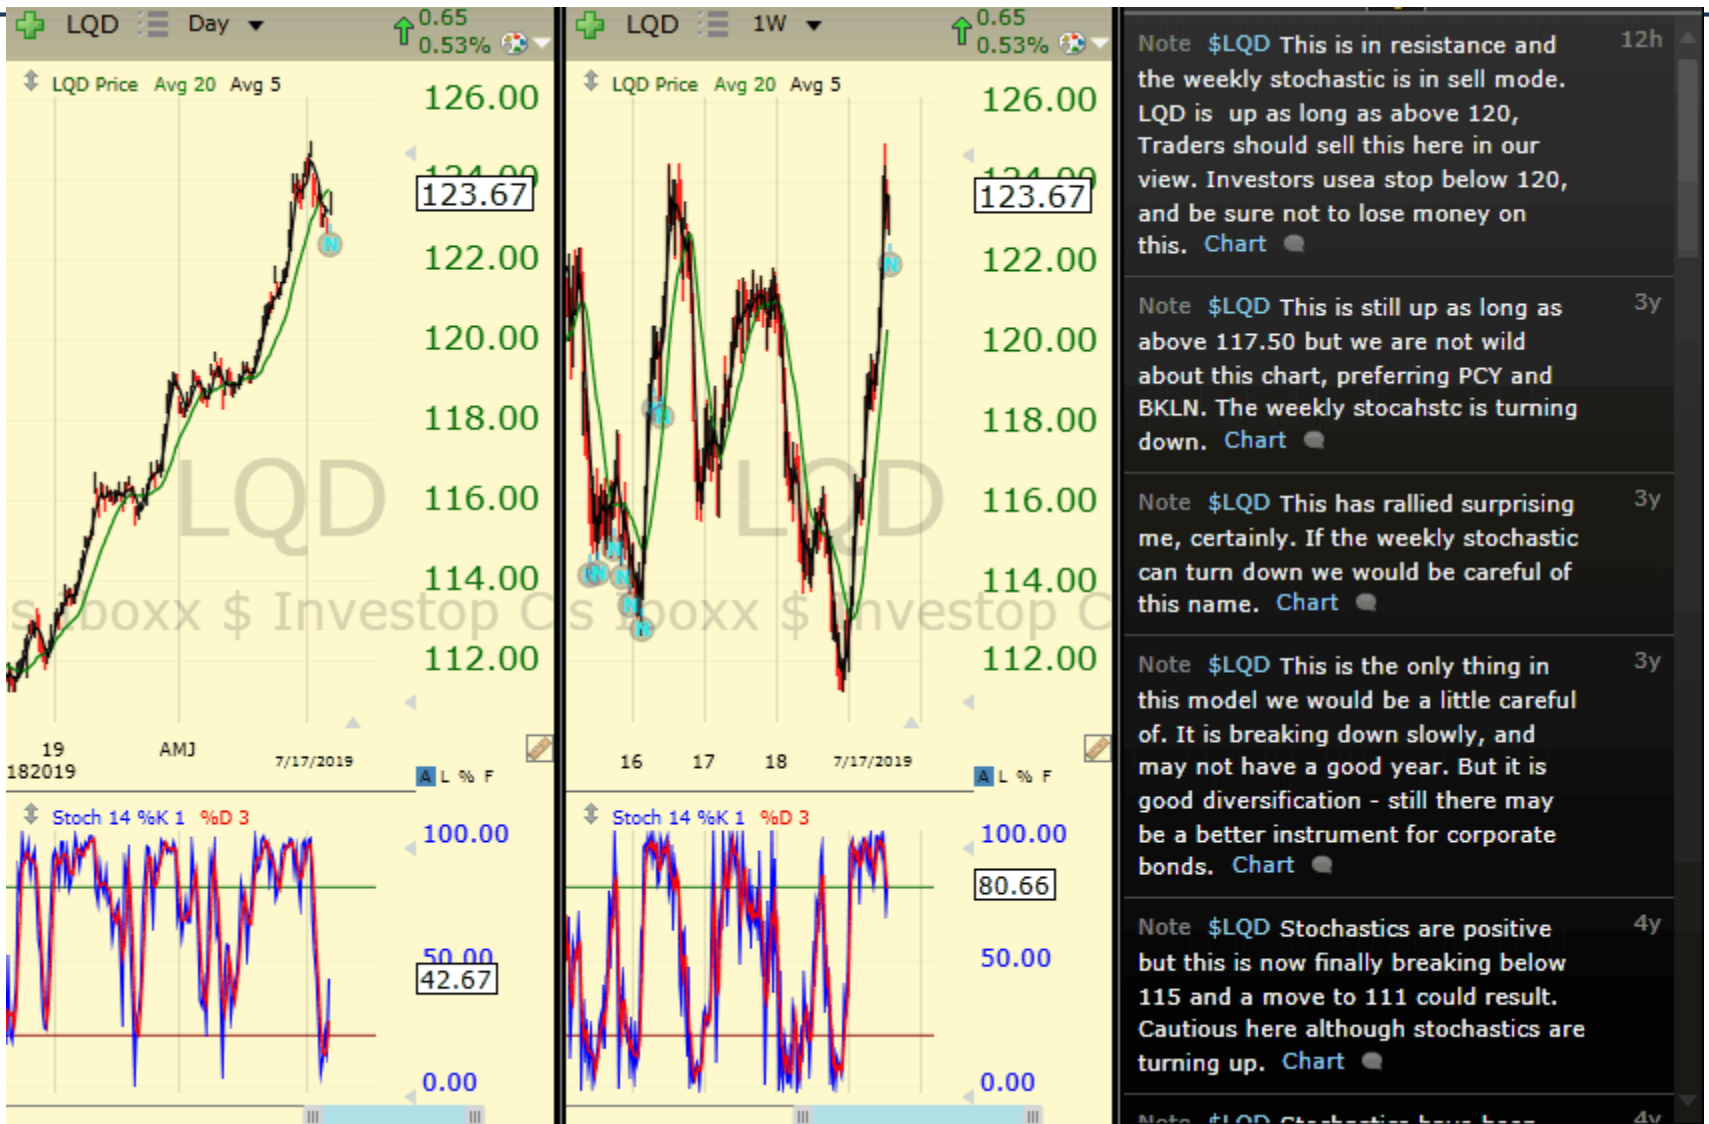

Note \$DWSH Closed just under \$25 if back above could go to \$28 which would happen with a market that heads lower. Remains a strong hedging tool. [Chart](#)

Note \$DWSH This is a short stock market ETF, and we know that many of our clients cannot use it. This would be a good speculation here, or just before the start of the Eurozone elections on May 23. Above 25 targets 28 or so. [Chart](#)

Technical Indicators

Readers will note that we use the same indicators on all of the charts in this presentation. We append definitions of these indicators and are available via the website: [Education and Training Center](#).

Technical Defined

Moving Averages:

Moving averages are one of the building blocks of Technical Analysis, and there are almost as many ways to use this indicator as there are technicians.

At the FRED report we teach and use a dual moving average crossover system to determine trend. Our favorites are the 5 period and 20 period moving averages. We consider the trend to be up if the 5 is above the 20, and down if below it.

Stochastics:

The Stochastic Oscillator is one of the commonly used momentum oscillators and is standard on charting programs. There are two lines on the chart below, %K and %D.

%K is the faster of the two lines, and represents a mathematical formula that *measures where the current close is in relation to the trading range of the last "X" periods of time*. We use a 14 period look-back, so in plain English %K says where the current close is in the trading range of the last 14 days, expressed as a %.

At the FRED report we use it somewhat differently than is commonly taught. The standard way to use the indicator is to register a buy signal when it moves below, and then above, 20 (the lowest 20% of closing prices in the last 14 days). A sell signal is when the indicator moves above, and then below 80 (the highest 80% of closes over the last 14 days).

The other line, %D, is a 3 period moving average of %K. We have found that the Stochastic is sensitive, so we advocate taking signals only in the direction of the trend. When looking at the standard FRED report chart, this would mean taking buy signals when the 5 is above the 20, and sell signals when the 5 is below the 20, but using a different technique to exit positions. The reason for this is the Stochastic is quite sensitive, and can give early indications, especially in new trends. It also can get "stuck" in the direction of trends, which connotes strength and not weakness. Another, preferred interpretation, is to use the indicator to measure risk. An example: buy in an uptrend, not when the stochastic is at 90% but rather wait until it falls below 50%, This way, even if a stock, commodity, or ETF does not give one of the "classic" signals, you can still use the indicator to assess risk, and leg into positions.

The FRED Report

Financial Research, Education & Data

The FRED Report (www.theFREDreport.com) was started to provide Financial Advisors and investors access to unbiased market research. The President of The Fred Report, **Fred Meissner, CMT** has been practicing Technical Market Analysis since 1983 and has worked in the research departments of Merrill Lynch and Robinson – Humphrey /Smith Barney. In addition he has served the public as a portfolio manager and financial advisor. We know the problems investors face and have devoted our career to helping find the best possible investments in all environments.
